

Quicklime Plus

The stabilization solution to variable soil conditions

With the introduction of Quicklime Plus, engineers now have a stabilization product that reacts favorably to variable site conditions.

- Quicklime Plus is simply Quicklime plus Portland Cement. “Plus” fills the gap between quicklime alone and cement alone.
- The processing of Quicklime Plus follows the same construction specifications as Quicklime alone.
- With the addition of pozzolans to the Quicklime, Plus will add strength to lean clays and silt, while still reducing the PI of the clay.
- Unconfined compressive strength (UCS) may show greater gains than if Quicklime & Pozzolans were placed separately.
- Hydraulic conductivity (permeability) of soils (PI 5 to 25) stabilized with Quicklime Plus is significantly lower than Quicklime or cement separately
